Dept. Agricultural Economics

August 8, 2025

Food and Agriculture Organization (FAO)

Agro-informatics connects information technology with the farm management, analysis and application of agricultural data to design more accurate and targeted agricultural interventions.

Examples of The Use of New Technology in Agriculture

Satellite Imagery

Remote Sensing

Geographic Information Systems (GIS)

Information and Technology in Agriculture

Information and Technology enable the transformation of data into actionable information.

Benefits of Agro-Informatics

- Enhanced Decision Making: With real-time data on soil health, weather patterns, and crop growth, farmers can make informed decisions that maximize their yield.
- Resource Optimization: Agriculture informatics helps optimize the use of resources such as water, fertilizers, and pesticides, reducing waste and environmental impact.
- Precision Agriculture: Through GPS and remote sensing technologies, farmers can precisely target their interventions, minimizing costs and environmental harm.

Benefits of Agro-Informatics

- Early Disease Detection: Monitoring tools and data analysis enable the early detection of disease outbreaks, preventing their spread and minimizing losses.
- Supply Chain Efficiency: Informatics streamlines the supply chain, reducing post-harvest losses and ensuring fresher produce reaches consumers.

Example of Agro-Informatics

Example of Agro-Informatics

Example of Agro-Informatics

In this class,

- We will combine agricultural economics and computer science.
- We will learn about how to collect, store, and analyze a variety of data used in agricultural economics.

- A variety of sources of data and information related to agricultural economics
- Statistics Korea, Bank of Korea, Government Agencies, AGRIX, etc
- International Agricultural Data (World Bank, FAO, etc)

Eliminating the digital divide

Ensuring all people through education, health, social protection, and gender equality	Promoting economic policies for growth	Sustaining the planet's natural resources for inclusive growth	Promoting clean energy access, sustainable transport and livable cities	Eliminating the digital divide
88%	10%	39,024	91.6%	65.4%
Primary completion rate, female (% of relevant age)	Poverty headcount ratio at \$3.00 a day (2021 PPP) (% of population), 2023	Carbon dioxide (CO2) emissions (total) excluding LULUCF (Mt CO2e), 2023	Access to electricity (% of population), 2023	Individuals using the Internet (% of population), 2023

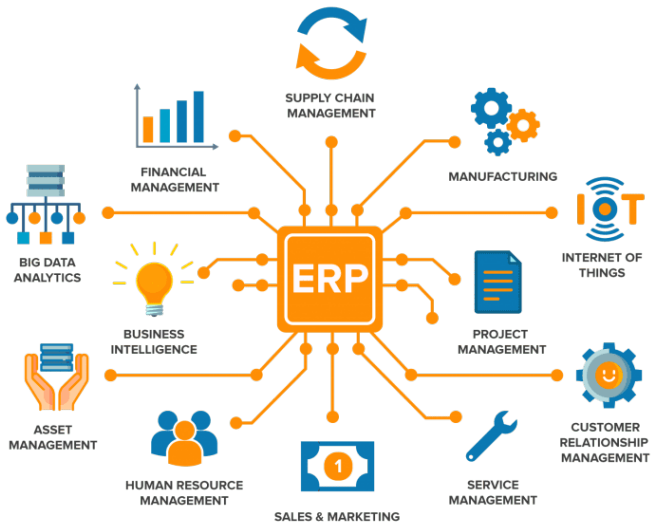

The screenshot shows the FAOSTAT website in a web browser. The header features the FAO logo and the text 'Food and Agriculture Organization of the United Nations'. A search bar is located in the top right corner. Below the header, there are navigation tabs: 'Data', 'Selected Indicators', 'Compare Data', 'Rankings', 'Definitions and Standards', and 'FAQ'. A search bar is also present below these tabs with the placeholder text 'Search an Indicator or Commodity'. The main section is titled 'Data' and has two sub-tabs: 'DOMAINS' and 'DOMAINS TABLE'. Under 'DOMAINS', there are two columns of domain categories, each with a right-pointing arrow icon:

- Production
- Food Security and Nutrition (SDG indicators)
- Food Balances
- Trade
- Prices
- Cost and Affordability of a Healthy Diet
- Food and Diet
- Population and Employment
- Investment (SDG indicator)
- Macro-Economic Indicators
- Food Value Chain
- Climate Change: Agrifood systems emissions
- Forestry

- Database Management System (DBMS, e.g., MS ACCESS)
- Enterprise Resource Planning (ERP)
- Structured Query Language (SQL)

Functional block	Supported functionality
Raw Data DB	<ul style="list-style-type: none"> Used for storing raw data as collected from the sensors, farming machinery, tracking systems, external services e.g., meteorological data These data are the property of farmer and can use them when switching from one FMS provider to another
Data collector DB	<ul style="list-style-type: none"> Used for placing all processed data (e.g., after statistical processing of raw data) and information related to a farmer (e.g., advices from an advisory system, executed actions, the results of these actions, etc.) It contains knowledge produced by the cognitive cycle (monitor, decision, execution, learning) or directly by a stakeholder (e.g. farmer, machinery manufacturer). Knowledge storage in the database is similar to the paradigm applied in the case of text-mining (Chakrabarti, 2002). During the latter, text is represented as a vector and associated with a class which in turn can be associated with any set of actions (i.e. web search). Following the analogy, in our case, knowledge is represented as a vector that can be classified and associated with any set of rules or actions
Data collector	<ul style="list-style-type: none"> Used to transfer data to and from the Data Collector Database and the Raw Data Database Provides information for further processing to the Data Analyzer and the Statistical Analyzer module and also communicates with the Notifier.
Data analyzer	<ul style="list-style-type: none"> Involved with the processing and analysis of different types of data and different types of context. It contains a multimedia analyzer. Checks periodically if some rules are violated or not Checks if some received values are not inside an expected range Communicates with the coordination module and the statistical analyzer
Statistical analyzer	<ul style="list-style-type: none"> It processes an amount of data using statistical functions Uses data mining techniques to inform about the system's performance Used to identify malfunctioning farming machinery or equipment (e.g., sensor).
Coordination module	<ul style="list-style-type: none"> Receives input from the Data Analyzer and the Statistical Analyzer and has the "intelligence" to handle simple situations (e.g., temperature increase inside a greenhouse) Coordinates the decisions reached by services the farmer is currently using Responsible for conflict resolution among services Triggers the execution module and the notifier. It is configurable from the Statistical Analyzer module or directly from external entities (e.g., farmers, equipment manufacturers) since it allows them to install "knowledge" in the form of pre-defined rules
Notifier	<ul style="list-style-type: none"> Used to inform stakeholders (e.g. farmers, buyers, spraying contractors, agriculturists, etc.) Adapts any type of information to an appropriate form for end-user's device
Execution module	<ul style="list-style-type: none"> Used for actions that can be executed automatically (e.g. open the windows start the ventilation system, initiate a firmware update, etc.). For those actions that cannot or the farmer wishes not to be executed automatically, the Notifier is responsible to inform the farmer with the appropriate information
Configuration and communication	<ul style="list-style-type: none"> Sets the communication channels to collect raw data from the sensors and the farming equipment/machinery Communicates with services provided from other parties Used to configuring all other modules of the system (e.g. set a threshold to the Data Analyzer) Is responsible for authentication and authorization Is the message dispatcher for all other modules of the FMS controller

SQL

Data Analysis

- Data: Raw, unorganized (unprocessed) facts that need context to become useful
- Information: Processed, organized, interpreted and analyzed data used for specific purposes (e.g., decision-making) by adding meaning and value
- Data is used for information, which is also can be used for other information.

- A collection of facts or statistics
- Unorganized
- Without context
- Can be quantitative (descriptive)
- Examples: Number of Farmers in South Korea, Agricultural Income per Farm Household, Rice prices, etc

Details: Information

- The result of analyzing and interpreting data
- Has context
- Can be used to help make decisions
- Examples: An increase in rice prices compared to previous year, Average agricultural income in Jeonnam and Jeonbuk with a comparison, etc
